## EXECUTIVE SUMMARY

---

One model was used to project future enrollment in MSAD 6. The model used is called the “Best Fit” model is a standard statistical model which projects enrollment based on historical trends and is considered the most likely future enrollment scenario to occur in MSAD 6 **IF** future enrollment follows historical patterns of enrollment.

- The term “best fit” refers to the strongest statistical correlation of trends. The reader should keep in mind the “best fit” model is not always the best fit for predicting future enrollment. This is often the case in situations where the “best fit” model does not adequately account for the impact of resident development, when residential development, economic or population changes are occurring in the area, or when significant and unexpected changes in migration trends or resident birth trends occur in a community.

To provide reasonable cushions for use in planning school facilities, the enrollment projections are presented in the report **Appendix** within ranges of plus and minus 10% for the PreK-8 grade groups, and plus and minus 5% for grades 9-12. In addition, more conservative ranges of plus and minus 3% across all grade levels are supplied. In completing the enrollment projections for MSAD 6, the major findings of this study are as follows:

### **Resident Birth Trends:**

Resident births during the 10-year period (2006-07 to 2015-16) influencing first grade enrollment over the last 10 years (2013-14 to 2022-23), fluctuated year-to-year, declining, on average.

- Average between 2006-07 to 2010-11 was 278 births.
- Average between 2011-12 to 2015-16 was 269 births.
  - Loss of 9 births, on average

Over the last 10-year period of available resident birth data, 2012-13 to 2021-22, births to residents of MSAD 6 averaged 263 births annually, with births significantly fluctuating year-to-year, ranging between 233 and 281 births.

- Average over the most recent 5-year period (2017-18 to 2021-22) was 260 births.
- Average over the last 3-years (2019-20 to 2021-22) was 255 births.
  - The most recent births were influenced by unusual birth years, 2019-20 which had 233 births, the lowest level seen, and was not repeated in 2020-21 where an unusually high level of births occurred (281 births)

When looking at the most recent 3-year average (2019-20 to 2021-22), or 255 births compared to births during the first 5-year period (2006-07 and 2010-11), or 278 births, MSAD 6 experienced an **average loss of 23 births per year**, translating into a loss of 1 class size per year.

The “best fit” projections used the sum of the births used for projections by Town in the district, or the 2022-23 “Best Fit” Model assumes resident births would average about 257 births annually. **Since MSAD 6 has experienced fluctuations in resident births in the past, it is reasonable to assume these fluctuations will continue in the future. However, it is impossible to predict which years will see higher or lower birth levels. Due to the influence resident births have on future first grade enrollment, MSAD 6 will need to keep an eye on future resident births.**

### **Preschool Migration Trends:**

In the first five years of the last decade, (2013-14 to 2017-18), MSAD 6 experienced an out-migration of preschool-aged children. The level of preschool out-migration increased over last five years (2018-19 to 2022-23), and last three years, (2020-21 to 2022-23) an out-migration occurred.

**Taken together, a decline in average resident births combined with an average preschool out-migration resulted in first grade class sizes that, on average, declined over the last five years. In addition, fluctuations in the level of resident births and preschool migration levels caused year-to-year fluctuations in first grade class sizes. The lower level of resident births combined with the continuation of the out-migration of students will mean lower levels of enrollment in the future.**

### **Grade-to-Grade Migration Ratio Trends:**

When looking at the average trends over the last three years, the most notable change occurred between grades 3-4, 7-8, and 11-12, but no changes to the 2022-23 “Best Fit” Model was needed to account for any of these changes.

- **At grades 3-4 an out-migration occurred over the last 3-year period compared to the in-migration occurring in the first 5-year period.**
  - Since the out-migration occurred during the 5-year period, 4-year period and 2-year period, this is indicative of a trend that would be accounted for by the 2022-23 “Best Fit” Model.
- **At grades 7-8 a higher in-migration occurred over the last two years than seen previously.**
  - While the in-migration is highest over this 2-year period, the in-migration was occurring during the last 5-year, 4-year and 3-year periods and would be accounted for by the 2022-23 “Best Fit” Model.
- **At grades 11-12, an out-migration occurred over the last 2-year period compared to the in-migration occurring in the first 5-year period.**
  - While the out-migration is highest over this 2-year period, the out-migration was occurring during the last 5-year, 4-year and 3-year periods and would be accounted for by the 2022-23 “Best Fit” Model.

### **New Housing Development Impact on Enrollment:**

New housing unit development in MSAD 6 has averaged 107 new housing units added annually over the last ten-year period and future development is estimated to occur between 100 and 155 new housing units added annually. Looking at the level of preschool and elementary migration compared to new housing unit development, revealed migration to be working independently from new housing development. Since a statistical correlation between migration trends and development in MSAD 6 was not found, an additional model based on new housing unit development was not needed for MSAD 6.

### **Recommendations:**

Outside forces such as changes in the economy, housing prices and/or new housing starts, Civilian Labor Force changes, or unexpected national, state, or local events can have an impact on enrollment trends which could in turn alter the outlook of enrollment in MSAD 6. Future enrollment should routinely be monitored for potential changes in trends, specifically looking to see if future enrollment deviates significantly from what is projected. In addition, the district should continue to routinely monitor births to residents, preschool migration trends, grade-to-grade migration trends, and local housing development trends for any notable changes.

### **2022-23 “Best Fit” Projections for MSAD 6 Resident Students:**

The 2022-23 “Best Fit” Model is based on 257 average births (sum of the averages used for each Town in MSAD 6), and on a continuation of preschool out-migration similar to the level occurring over the last ten years, except for the 2023-24 first grade which was based on the 2022-23 Kindergarten enrollment and the 3-year weighted ratio of first grade to Kindergarten.

#### **First Grade Class Size:**

- Under the 2022-23 “Best Fit” Model, first grade enrollment is projected to experience yearly swings corresponding with swings in resident births. Enrollment is projected to range between 219 and 264 students, and average 242 students annually through 2032-33.

#### **Grade Group Enrollment:**

- PreK-5 resident attending enrollment will remain similar to the current enrollment of 1,510 students to range between 1,502 and 1,521 students through 2024-25. Following 2024-25, enrollment is projected to decline, but should level off to range between 1,472 and 1,492 students through 2032-33.
  - *Another 13 to 14 MSAD 6 resident students in grades PreK-5 are projected to attend non-district schools each year through 2032-33.*
  - *Approximately 36 to 42 nonresident students are projected to attend PreK-8 in MSAD 6 each year through 2032-33.*
- Grades 6-8 resident attending enrollment decline from the current enrollment of 731 students to range between 703 and 720 students through 2026-27. Following 2026-27, enrollment is expected to decline further, but should remain stable, ranging between 681 and 703 students through 2032-33.
  - *Another 14 MSAD 6 resident students in grades 6-8 are projected to attend non-district schools each year through 2032-33.*
  - *Approximately 4 nonresident students are projected to attend grades 6-8 in MSAD 6 each year through 2032-33.*
- Grades 9-12 resident attending enrollment will be similar to the current enrollment of 1,013 students to range between 1,003 and 1,029 students through 2024-25. Following 2024-25, enrollment is projected to decline reaching 944 students in 2026-27. Following 2026-27, enrollment is projected to decline further, but should remain stable, ranging between 896 and 934 students through 2032-33.
  - *Another 49 to 56 MSAD 6 resident students in grades 9-12 are projected to attend non-district schools each year through 2032-33.*
  - *Approximately 7 to 8 nonresident students are projected to attend grades 9-12 in MSAD 6 each year through 2032-33.*

---

## I. INTRODUCTION

---

Change in school enrollment derives from two sources, changes in the number of births to residents, and the net migration of preschool and school-aged children into and out of a community. These projections reflect both sources of change.

The projections are based on an in-house cohort survival model which contains two steps.

- First, historical trends and relationships between entering class sizes (first grade enrollment) and resident births in the year that is six years before the enrollment year is analyzed. Correlation coefficients (using Pearson's r-squared) are calculated for the last three, four, five, six, seven, eight, nine and ten-year periods regarding the relationship between first grade enrollment and births. The correlation coefficients are examined to determine which period represents the statistical "best fit" for projecting future first grade enrollment based on resident birth data.
- Second, historical trends at each grade level are analyzed, specifically looking at the grade-to-grade survival ratios. These ratios represent the number of students in a grade in one year (i.e., 1<sup>st</sup> grade in 2021-22) in relation to the number of students in the next grade the following year (i.e., 2<sup>nd</sup> grade in 2022-23). Then correlation coefficients (using Pearson's r-squared) are calculated for the last three, four, five, six, seven, eight, nine and ten-year periods regarding the relationship between enrollment in a grade in one year and the next grade the following year to determine which period represents the statistical "best fit" at each of the grade levels. The grade-to-grade ratios that represent the "best fit" are then applied to the current enrollment in each grade and projected first grade classes to project enrollment for the next ten years.
- To provide reasonable cushions for use in the planning of school facilities, school enrollment projections are summarized by grade group and presented the projections within ranges of plus and minus 10% for grades PreK-8 and plus and minus 5% for grades 9-12, and plus and minus 3% for grades PreK-12. These ranges and details on the enrollment data and methodologies used for making the projections can be found in the report **Appendix**.

**Sections II and IV** of this report provides historical enrollment trends and a set of enrollment projections which projects enrollment through 2032-33 for each grade and by grade group in MSAD 6. **Section III** discusses the historical grade-to-grade migration trends used to complete the projections.

**Section V** of this report presents economic trends, population trends, and residential development factors that may influence enrollment projections.

Grade-by-grade historical and projected enrollment, and ranges for use in school facilities planning are presented in the report **Appendix** along with a detailed explanation of the data used and methodologies.

---

## II. FIRST GRADE ENROLLMENT

---

### A. Historical First Grade Enrollment

First grade enrollment over the last ten years (2013-14 to 2022-23) fluctuated year-to-year while declining, on average. During this ten-year period, first grade enrollment ranged between 229 and 277 students, with an average enrollment of 257 students. The average first grade enrollment over the last five years (2018-19 to 2022-23), was 250 students, a lower average level of enrollment compared with the average of the previous five-year period (2013-14 to 2017-18), or 264 students. Enrollment over the last three years (2020-21 to 2022-23) declined further from the most recent five-year average, with first grade enrollment averaging 240 students. *(See Table II-1 and Figure-2).*

### B. Resident Births Influencing Historical Enrollment

Resident births during the ten-year period (2006-07 to 2015-16) influencing first grade enrollment over the last ten years (2013-14 to 2022-23), fluctuated year-to-year, declining, on average. The average number of births over the last five years of the period, (2011-12 to 2015-16), was 269 births, which was 9 births lower than the previous five-year period (2006-07 to 2010-11), which had an average of 278 births per year. However, over the last three years of the period (2013-14 to 2015-16) births averaged 271 births annually. **Overall resident births in MSAD 6 have fluctuated year-to-year while declining on average, placing downward pressure on first grade class sizes over the last ten years.** *(See Table II-1 and Figure-1).*

### C. Resident Births Influencing Future Enrollment

Over the last ten-year period of available resident birth data, 2012-13 to 2021-22, births to residents of MSAD 6 averaged 263 births annually, with births significantly fluctuating year-to-year, ranging between 233 and 281 births. The most recent five-year period (2017-18 to 2021-22) declined to average 260 births, and over the last three years (2019-20 to 2021-22) the average of births to residents continued to decline, to average 255 births. The most recent births were influenced by unusual birth years, 2019-20 which had 233 births, the lowest level seen, and was not repeated in 2020-21 where there was a high level of births, or 281 births occurred. When looking at the most recent average of births compared to births between 2006-07 and 2010-11 (average of 278 births per year), MSAD 6 experienced an average loss of 23 births per year, and a loss of 23 births per year translates into a loss of 1 class size per year. *(See Table II-1 and Figure 1).*

The “best fit” projections used the sum of the births used in the projections by Town in MSAD 6, or the 2022-23 “Best Fit” Model assumes resident births would average about 257 births annually, a level of births falling in-between the most recent three-year (2019-20 to 2021-22) and five-year (2017-18 to 2021-22) average of births. **Additionally, since MSAD 6 has experienced fluctuations in resident births in the past, it is reasonable to assume these fluctuations will continue to occur in the future. However, it is impossible to predict which years will see higher or lower birth levels. Due to the influence resident births have on future first grade enrollment, the district will need to keep an eye on future resident births.**

#### D. Net Preschool Migration Trends

In the first five years of the last decade, (2013-14 to 2017-18), MSAD 6 experienced an out-migration of preschool-aged children, with an average migration ratio of 0.960, or first grade experienced an average decline of about 4% from the number of births six years prior. In the past five years, (2018-19 to 2022-23), MSAD 6 experienced a higher level of preschool out-migration, with an average migration ratio of 0.929, or an average decline of 7.1%. Additionally, over the last three years, (2020-21 to 2022-23), preschool out-migration continued, and at a rate higher than the five-year period, with an average ratio of 0.888, or an average 11.2% loss from births. **Overall, when looking at average migration trends the average preschool out-migration placed downward pressure on first grade class sizes. (See Table II-1).**

While the average trends show preschool out-migration, when looking at the year-by-year migration trends there appears to have been significant year-to-year fluctuations in migration. For example, in 2019-20 an in-migration of 5.9% occurred, then in 2020-21 an out-migration of 9.5% occurred. While the first thought would be this is the result of the Global COVID-19 Pandemic, the preschool migration did not return to an in-migration over the last two years, and instead out-migration increased.

Since historically there have been fluctuations in the year-to-year migration trends it stands to reason that future first grade classes will experience similar year-to-year fluctuations. This makes accurately projecting the first-grade class sizes more difficult as there is no way to predict what future fluctuations will look like year-to-year. Therefore, the district will need to keep an eye on the first-grade class sizes, keeping in mind that fluctuations in enrollment will continue to occur.

**NOTE: Taken together, a decline in average resident births combined with an average preschool out migration resulted in first grade class sizes that, on average, declined over the last five years. In addition, fluctuations in the level of resident births and preschool migration levels caused year-to-year fluctuations in first grade class sizes.**

#### E. Projections of Entering First Grade Class Sizes

The 2022-23 “Best Fit” Model is based on 257 average births (sum of the averages used for each Town in MSAD 6), and on a continuation of preschool out-migration similar to the level occurring over the last ten years, except for the 2023-24 first grade which was based on the 2022-23 Kindergarten enrollment and the 3-year weighted ratio of first grade to Kindergarten. *(See Table II-1 and Figure-2).*

- Under the 2022-23 “Best Fit” Model, first grade enrollment is projected to experience yearly swings corresponding with swings in resident births. Enrollment is projected to range between 219 and 264 students, and average 243 students annually through 2032-33.

**Table II-1 - Relationship of Entering First Grade Class Size to Resident Births**  
**MSAD 6 - Resident Attending Enrollment**

Birth Year (Oct. 15 - Oct. 14)	# of Resident Births	First Grade Year	Best Fit Model		
			Enrollment	Ratio 1st/Births	+/-%
2006-07	336	2013-14	277	0.824	-17.6%
2007-08	272	2014-15	273	1.004	0.4%
2008-09	291	2015-16	276	0.948	-5.2%
2009-10	243	2016-17	240	0.988	-1.2%
2010-11	246	2017-18	255	1.037	3.7%
2011-12	282	2018-19	260	0.922	-7.8%
2012-13	253	2019-20	268	1.059	5.9%
2013-14	263	2020-21	238	0.905	-9.5%
2014-15	278	2021-22	254	0.914	-8.6%
2015-16	271	2022-23*	229	0.845	-15.5%
2016-17	265	2023-24	243	0.917	-8.3%
2017-18	272	2024-25	256	0.941	-5.9%
2018-19	263	2025-26	247	0.939	-6.1%
2019-20	233	2026-27	219	0.940	-6.0%
2020-21	281	2027-28	264	0.940	-6.0%
2021-22*	252	2028-29	237	0.940	-6.0%
2022-23 est	257	2029-30	241	0.938	-6.2%
2023-24 est	257	2030-31	241	0.938	-6.2%
2024-25 est	257	2031-32	241	0.938	-6.2%
2025-26 est	257	2032-33	241	0.938	-6.2%
<b>10-Yr Avg. (2006-07 to 2015-16)</b>	274	<b>10-Yr Avg. (2013-14 to 2022-23)</b>	257	0.945	-5.5%
<b>5-Yr Avg. (2006-07 to 2010-11)</b>	278	<b>First 5-Yr Avg. (2013-14 to 2017-18)</b>	264	0.960	-4.0%
<b>5-Yr Avg. Births (2011-12 to 2015-16)</b>	269	<b>Most Recent 5-Yr Avg. (2018-19 to 2022-23)</b>	250	0.929	-7.1%
<b>Births 3-Yr Avg. (2013-14 to 2015-16)</b>	271	<b>Most Recent 3-Yr Avg. (2020-21 to 2022-23)</b>	240	0.888	-11.2%
<b>Most Recent 10-Yr Avg. (2012-13 to 2021-22)</b>	263	<b>Projected 10-Yr Avg. (2023-24 to 2032-33)</b>	<b>243</b>	0.937	-6.3%
<b>Most Recent 5-Yr Avg. (2017-18 to 2021-22)</b>	260				
<b>Most Recent 3-Yr Avg. (2019-20 to 2021-22)</b>	255				

**Births:** Maine Center for Disease Control and Prevention, Data, Research and Vital Statistics. 2022 births are preliminary and provisional; \*Future births between 2022-23 and 2025-26 were based on the sum of the births used for each town's first grade enrollment projections. **Note:** Enrollment includes all resident students attending district schools. First to birth ratios shown here are based on the rounded first grade projection from the Entering Class to Births Ratio Worksheet. **Historical Enrollment Source:** 2012-2017 from MDOE, 2018-2022 from the district. All else calculated by Wandell Consulting.

### III. GRADE-TO-GRADE MIGRATION TRENDS

---

After assessing preschool-migration trends and establishing first grade enrollment, the migration trends between grades are examined and grade-to-grade survival ratios are established. These ratios represent the number of students in a grade in one year (i.e., 1<sup>st</sup> grade in 2021-22) in relation to the number of students in the next grade the following year (i.e., 2<sup>nd</sup> grade in 2022-23). The historical average grade-to-grade survival ratios for the last three, four, five, six, seven, eight, nine and ten-year periods are analyzed to determine which period represents the statistical “best fit” at each of the grade levels. The grade-to-grade ratios that represent the “best fit” are then applied to the current enrollment in each grade and projected first grade classes to project enrollment for the next ten years. This section will show how the grade-to-grade migration trends have changed, on average, in MSAD 6.

*Appendix Table-3* shows average grade-to-grade survival ratios in MSAD 6 for grades K-12 along with how the ratios translate into a loss or addition of new students. For example, the 10-year K-1 average ratio was 0.989, this translates to an average student out-migration of 1.1% between Kindergarten and first grade over the last decade. When looking at the grade-to-grade ratios over the last two years (2021-22 to 2022-23) and three years (2020-21 to 2022-23) compared to what occurred over the first five-years of the period examined (2013-14 to 2017-18), student migration trends in MSAD 6 have changed somewhat.

The most notable change occurred between grades 3-4, 7-8, and 11-12.

- **At grades 3-4 an out-migration occurred over the last 3-year period compared to the in-migration occurring in the first 5-year period.**
  - Since the out-migration occurred during the 5-year period, 4-year period and 2-year period, this is indicative of a trend that would be accounted for by the 2022-23 “Best Fit” Model.
- **At grades 7-8 a high in-migration occurred over the last two years than seen previously.**
  - While the in-migration is highest over this 2-year period, the in-migration was occurring during the last 5-year, 4-year and 3-year periods and would be accounted for by the 2022-23 “Best Fit” Model.
  - However, the district should keep an eye on the migration between grades 7 and 8.
- **At grades 11-12, an out-migration occurred over the last 2-year period compared to the in-migration occurring in the first 5-year period.**
  - While the out-migration is highest over this 2-year period, the out-migration was occurring during the last 5-year, 4-year and 3-year periods and would be accounted for by the 2022-23 “Best Fit” Model.
  - However, the district should keep an eye on the migration between grades 11 and 12.

What this means is while there has been some change in overall grade-to-grade migration at a couple of grade levels, the changes are not so significant that additional modeling was warranted. Instead, the 2022-23 “Best Fit” Model accounts for variations in the plus and minus ranges of 3%, 5%, and 10% supplied. Therefore, the 2022-23 “Best Fit” model for MSAD 6 is the most reasonable model to project future on enrollment trends.

### Appendix Table 3

#### MSAD 6 Attending Enrollment - Average Grade-to-Grade Survival Ratios - 2022-23 Best Fit Model

School Year	Grade											
	K-1		1-2		2-3		3-4		4-5		5-6

2022-23 Best Fit Model Enrollment Projections for MSAD 6, Completed June 2023

Data produced by Wandell Consulting

---

## IV. RESIDENT AND ATTENDING ENROLLMENT TRENDS

---

The resident figures include all resident students attending MSAD 6 schools, and resident students attending school outside of the district except for 100% home schooled students and any students attending private schools. The projections are also provided in ranges of plus and minus 3% and 10% for grades PreK-8, and 3% and 5% for grades 9-12. *(See Appendix Tables 2 through 10 and Figures 3 through 6).*

In addition to the MSAD 6 enrollment as a district, enrollment for each town (Buxton, Hollis, Limington, and Standish) in the district was completed and supplied in the following Sections V through VIII. However, due to the smaller population sizes in each of the towns involved, there was a significant amount of skewing of the data and migration ratios. Due to the skewing of data, the enrollment projections by town are less reliable than enrollment projections completed using the enrollment data for the district. However, the enrollment projections by town should provide some insight on what birth and enrollment trends have been in each town. Additionally, the “Best Fit” models should provide some guidance on the overall enrollment outlook in each town. Detailed tables and charts for each town can be found in the report Appendix.

### A. Resident and Attending Enrollment Trends and Projections for Grades PreK-5

#### Historical Trends:

Since 2012-13, resident attending enrollment in grades PreK-5 declined from 1,773 students in 2012-13 to reach 1,480 students by 2021-22. Following 2021-22 enrollment increased slightly to reach 1,510 students in 2022-23.

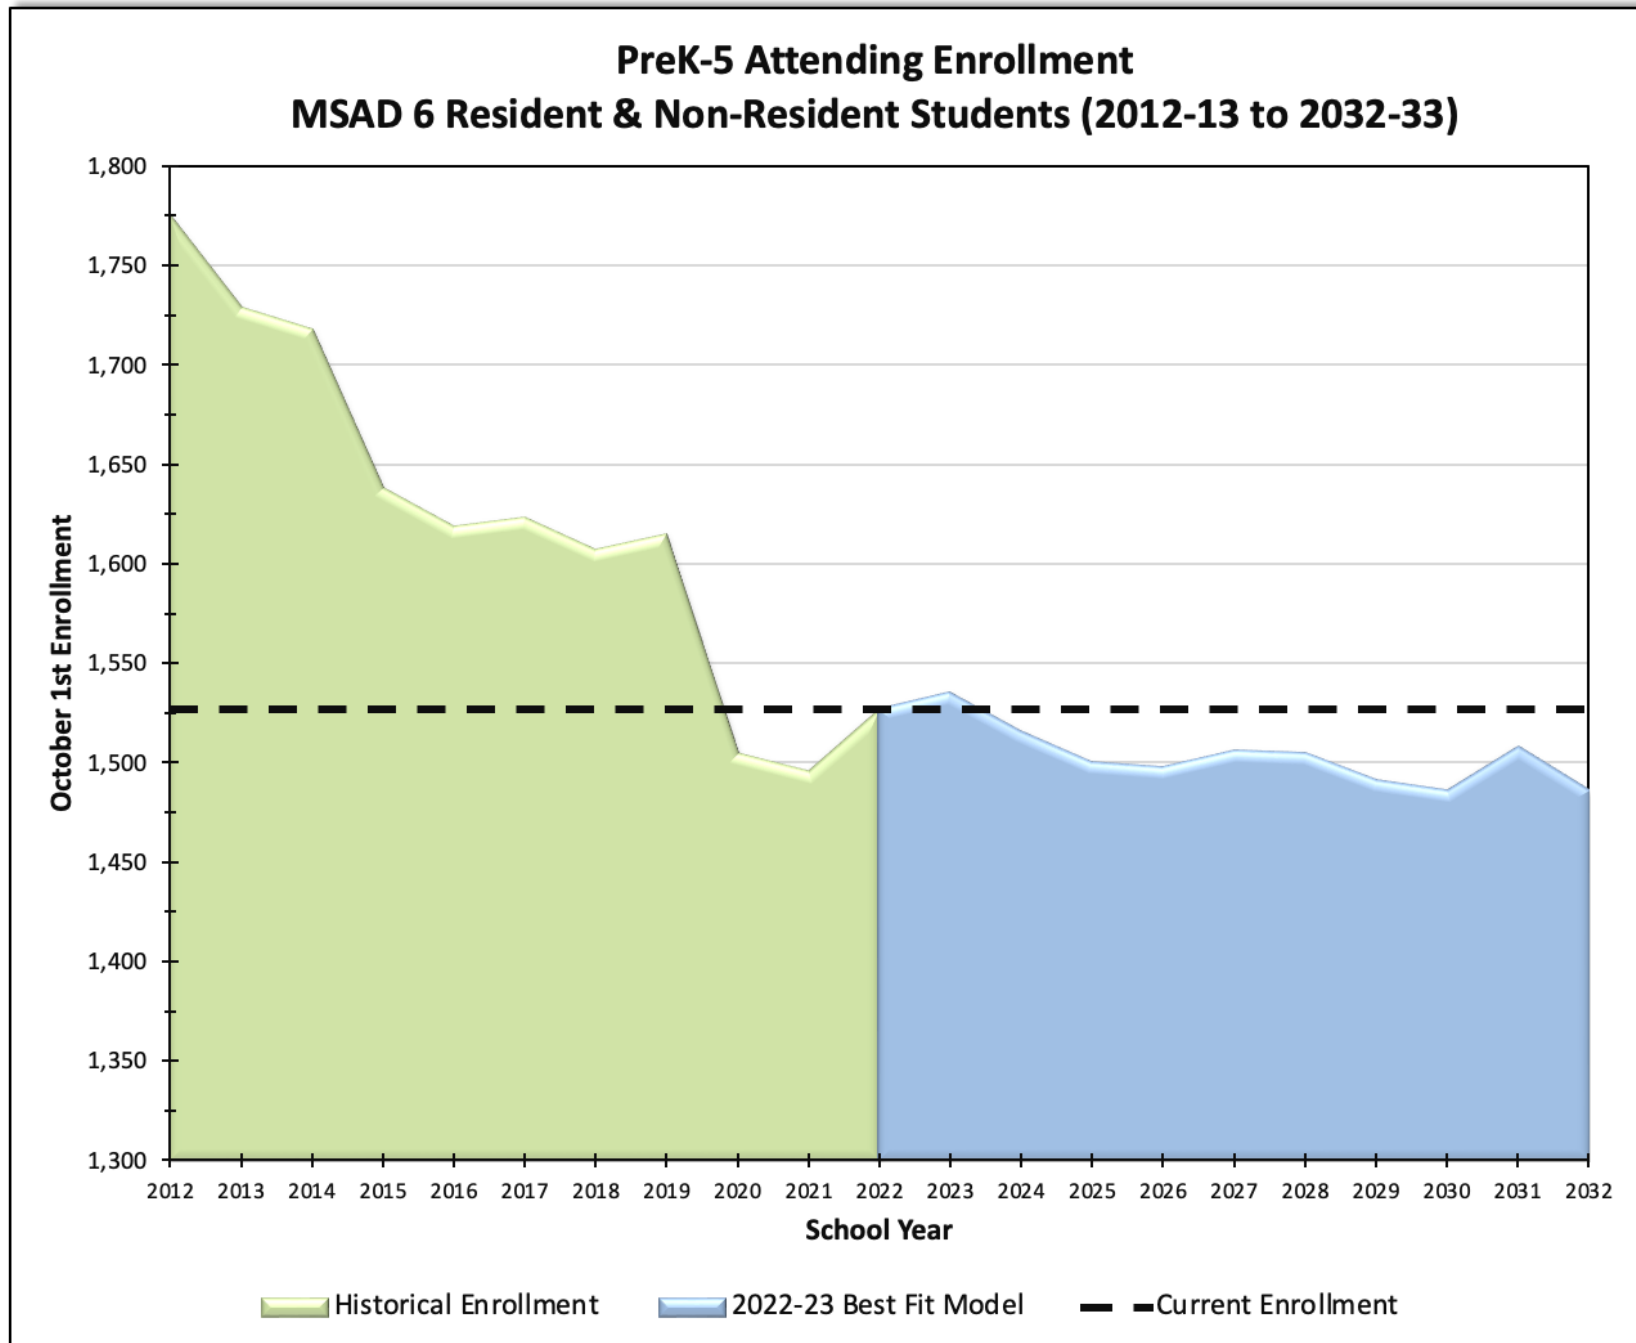

- *Enrollment of MSAD 6 students attending out of district schools ranged between 5 and 7 students through 2013-14 before increasing to range between 11 and 20 students through 2022-23.*
- *Enrollment of non-resident students attending district schools ranged between 2 and 15 students through 2019-20. Following 2019-20, enrollment of out of district students increased to range between 16 to 17 students through 2022-23.*

#### 2022-23 “Best Fit” Model:

Under the 2022-23 “Best Fit” Model, PreK-5 resident attending enrollment will remain similar to the current enrollment of 1,510 students to range between 1,502 and 1,521 students through 2024-25. Following 2024-25, enrollment is projected to decline, but should level off to range between 1,472 and 1,494 students through 2032-33.

- *Another 13 to 14 MSAD 6 resident students in grades PreK-5 are projected to attend non-district schools each year through 2032-33.*
- *Approximately 14 nonresident students are projected to attend PreK-5 in MSAD 6 each year through 2032-33.*

Figure 3

## **B. Resident and Attending Enrollment Trends and Projections for Grades 6-8**

### **Historical Trends:**

Since 2012-13, resident attending enrollment in grades 6-8 fluctuated year-to-year, ranging between 879 and 920 students through 2015-16. Following 2015-16, enrollment declined to 731 students by 2022-23.

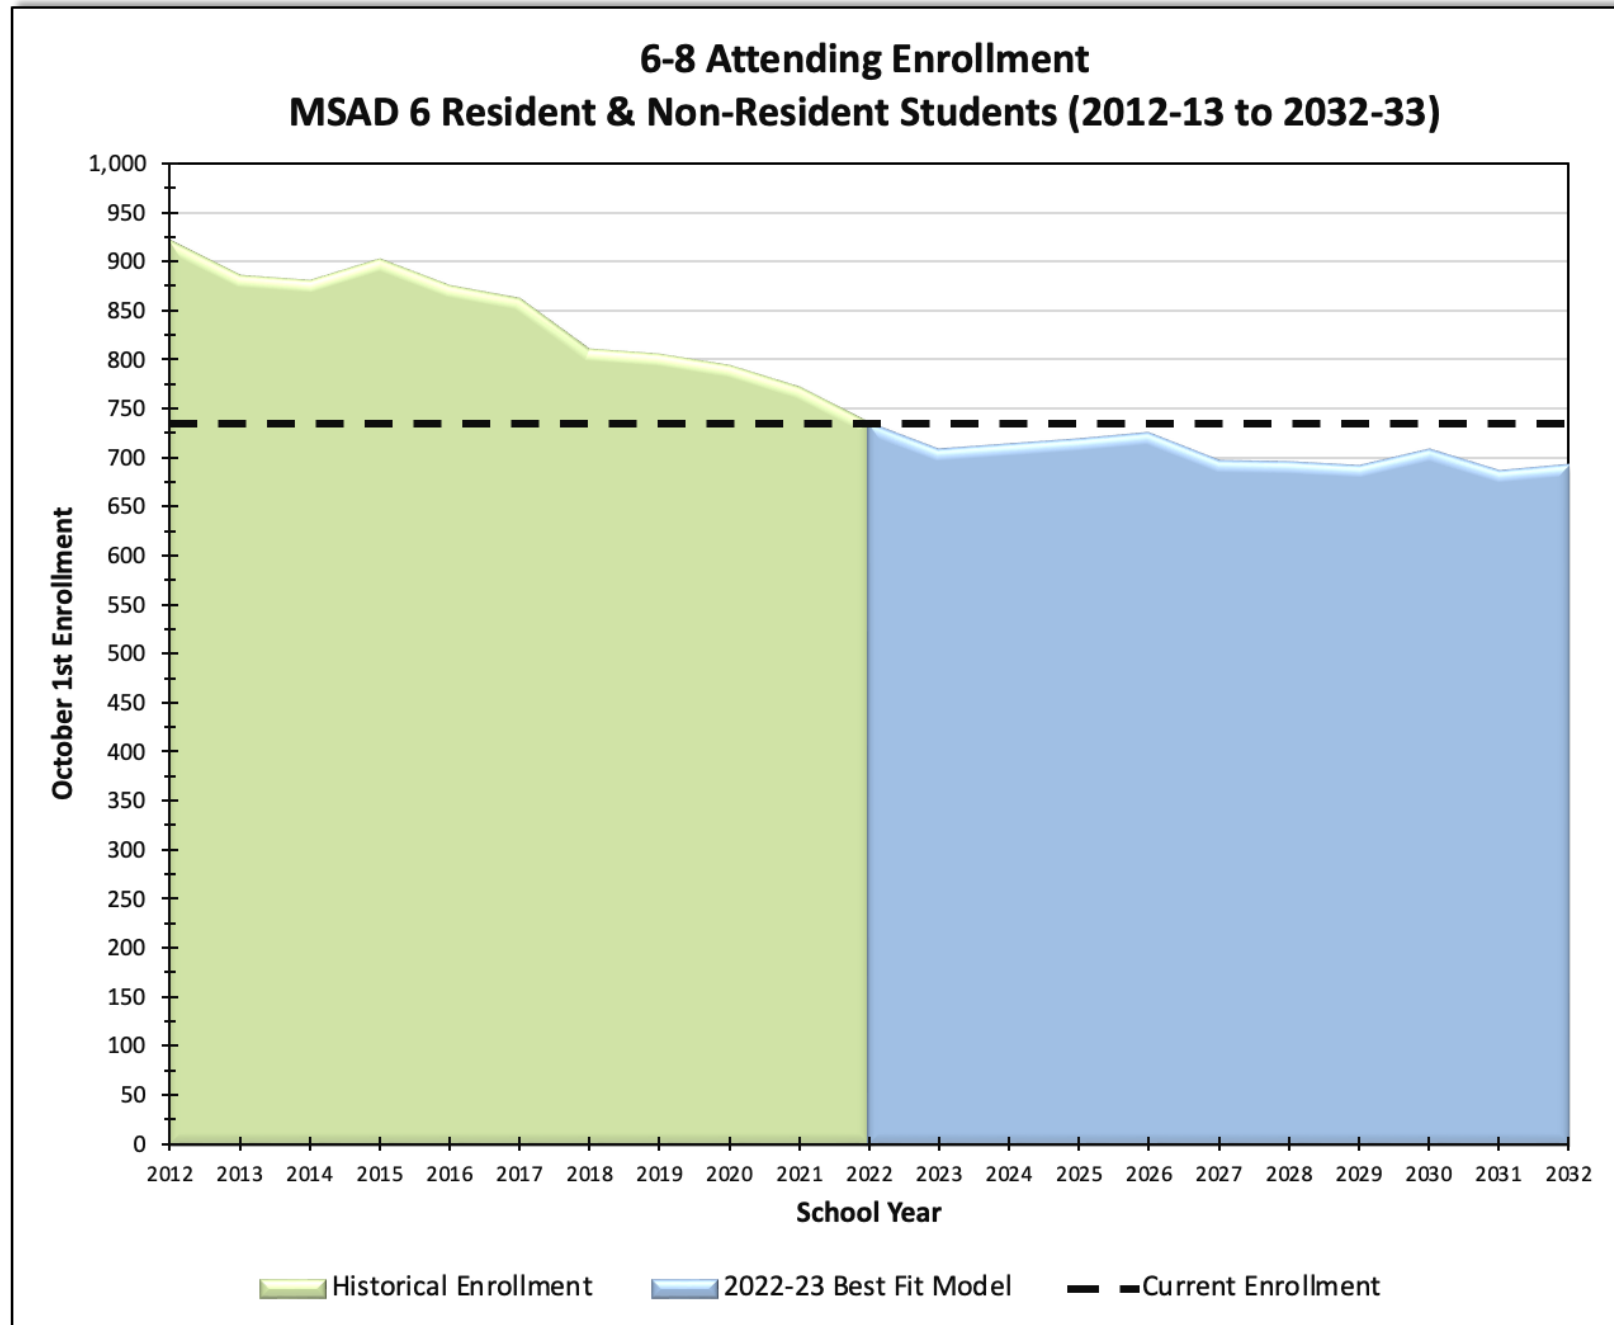

- *Enrollment of MSAD 6 students attending out of district schools ranged between 2 and 5 students through 2013-14, then increased to range between 12 and 21 students through 2022-23.*
- *Enrollment of non-resident students attending district schools ranged between zero and 7 students through 2022-23.*

### **2022-23 “Best Fit” Model:**

Under the 2022-23 “Best Fit” Model, 6-8 resident attending enrollment decline from the current enrollment of 731 students to range between 703 and 720 students through 2026-27. Following 2026-27, enrollment is expected to decline further, but should remain stable, ranging between 681 and 703 students through 2032-33.

- *Another 13 to 14 MSAD 6 resident students in grades 6-8 are projected to attend non-district schools each year through 2032-33.*
- *Approximately 4 nonresident students are projected to attend grades 6-8 in MSAD 6 each year through 2032-33.*

Figure 4

## C. Resident and Attending Enrollment Trends and Projections for Grades 9-12

### Historical Trends:

Since 2012-13, resident attending enrollment in grades 9-12 fluctuated year-to-year, ranging between 1,150 and 1,184 students through 2014-15. Following 2014-15, enrollment declined to 1,013 students by 2022-23.

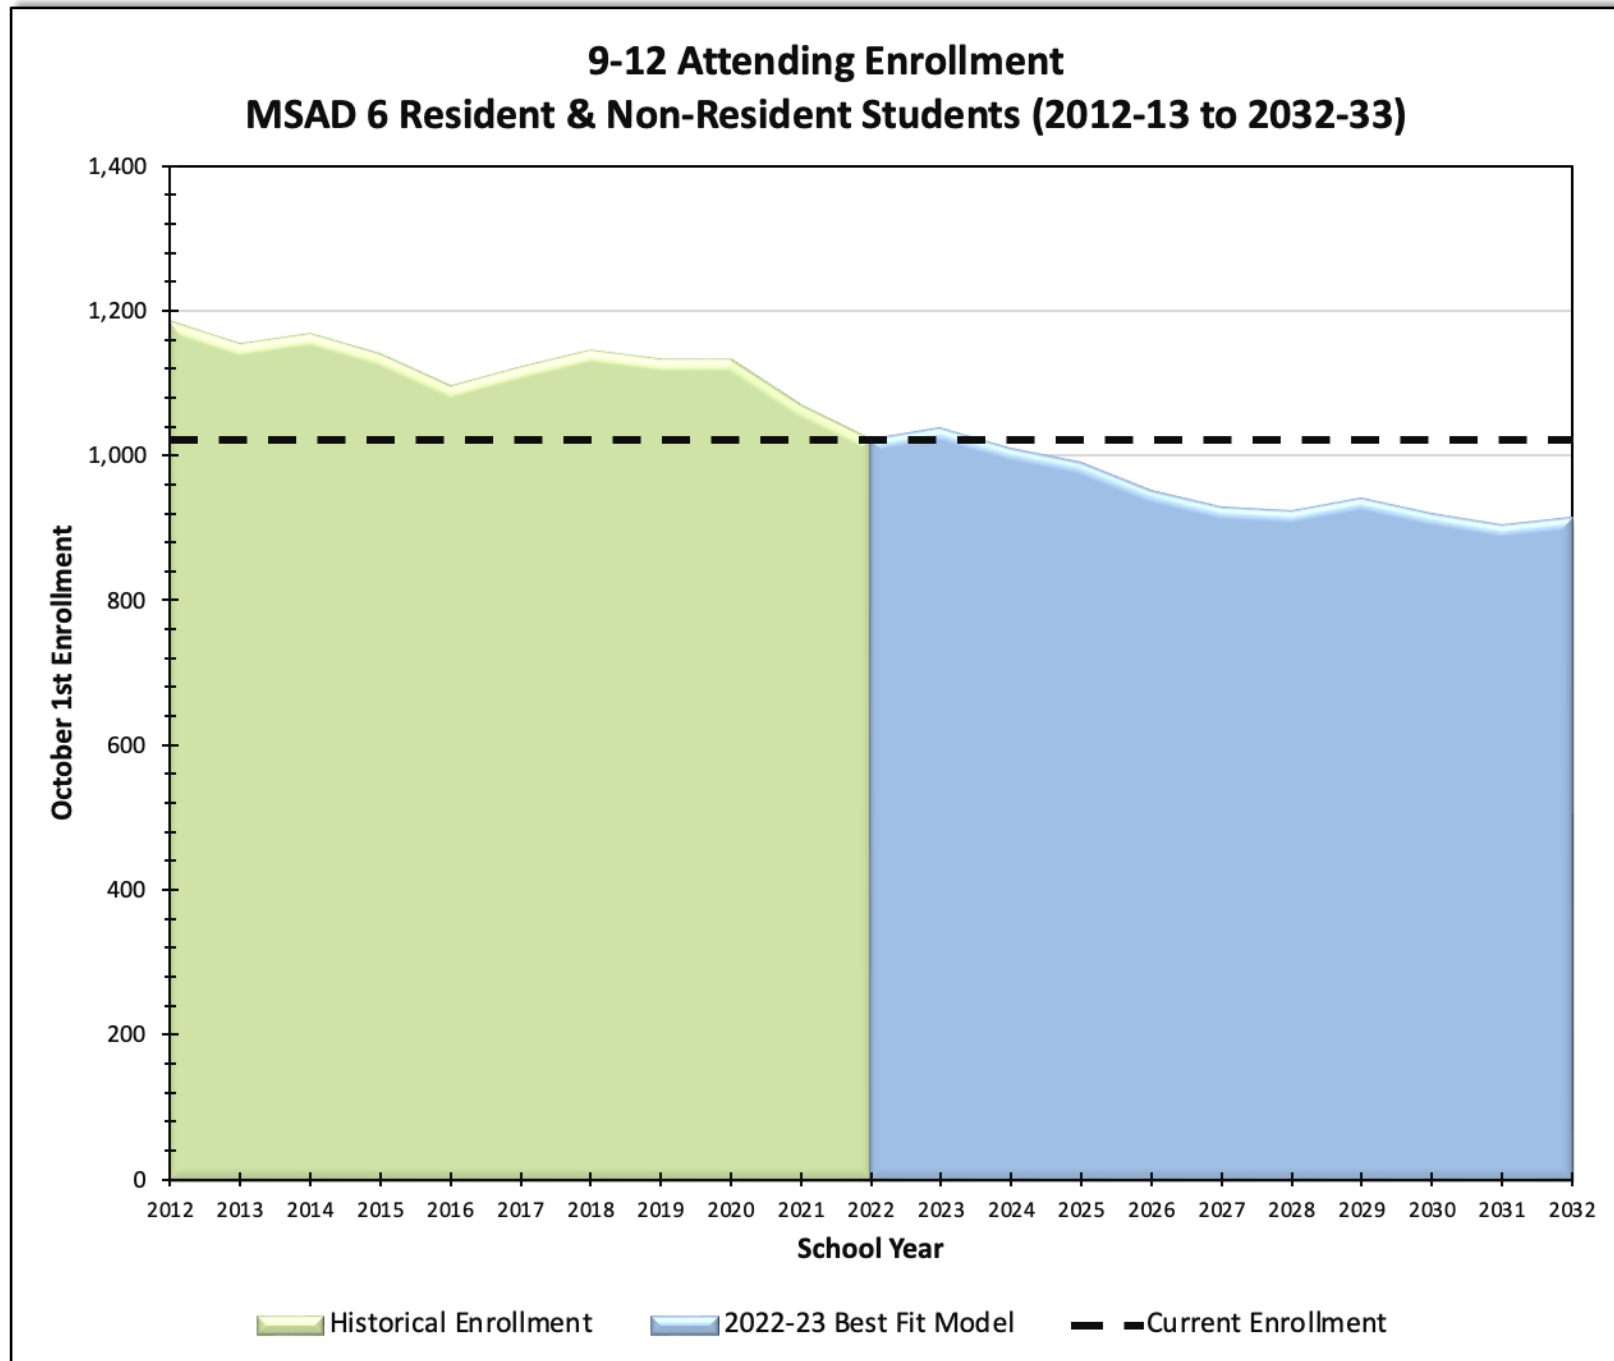

- *Enrollment of MSAD 6 students attending out of district schools ranged between 6 and 39 students through 2014-15. Following 2014-15, enrollment increased to range between 53 and 87 students through 2022-23.*
- *Enrollment of non-resident students attending district schools ranged between 1 and 11 students through 2022-23.*

### 2022-23 “Best Fit” Model:

Under the 2022-23 “Best Fit” Model, 9-12 resident attending enrollment will be similar to the current enrollment of 1,013 students to range between 1,003 and 1,029 students through 2024-25. Following 2024-25, enrollment is projected to decline reaching 944 students by 2026-27. Following 2026-27, enrollment is projected to decline further, but should remain stable, ranging between 896 and 934 students through 2032-33.

- *Another 49 to 56 MSAD 6 resident students in grades 9-12 are projected to attend non-district schools each year through 2032-33.*
- *Approximately 7 to 8 nonresident students are projected to attend grades 9-12 in MSAD 6 each year through 2032-33.*

## V. ATTENDING FIRST GRADE AND PREK-5 ENROLLMENT FOR BUXTON

---

### A. Historical First Grade Enrollment

First grade enrollment in Buxton over the last ten years (2013-14 to 2022-23) fluctuated year-to-year while declining, on average. During this ten-year period, first grade enrollment ranged between 64 and 94 students, and averaged 78 students. The average first grade enrollment over the last five years (2018-19 to 2022-23), was 74 students, 9 students less than the average of the previous five-year period (2013-14 to 2017-18), or 83 students. Enrollment over the last three years (2020-21 to 2022-23) declined further, with first grade enrollment averaging 72 students. *(See Table II-1-1 and Figure 8).*

### B. Resident Births Influencing Historical Enrollment

Resident births in Buxton during the ten-year period (2006-07 to 2015-16) influencing first grade enrollment over the last ten years (2013-14 to 2022-23), fluctuated year-to-year, but remained stable, on average. The average number of births over the last five years of the period, (2011-12 to 2015-16), was 84 births, which was only 1 birth lower than the previous five-year period (2006-07 to 2010-11), which had an average of 85 births per year. In addition, over the last three years of the period (2013-14 to 2015-16) births continued to remain stable, averaging 86 births annually. *(See Table II-1-1 and Figure 7).*

### C. Resident Births Influencing Future Enrollment

Over the last ten-years, 2012-13 to 2021-22, births to residents of Buxton declined, to average 78 births annually, with births significantly fluctuating year-to-year, ranging between 59 and 90 births. The most recent five-year period (2017-18 to 2021-22) declined to average 76 births, and over the last three years (2019-20 to 2021-22) the average of births to residents continued to decline, to average 73 births. The most recent births were influenced by unusual birth years, 2019-20 which had 59 births, the lowest level seen, and was not repeated in 2020-21 where there was a high level of births where 88 births occurred. When looking at the most recent average of births compared to births between 2006-07 and 2010-11 (average of 85 births per year), Buxton experienced an average loss of about 11 births per year, and a loss of 11 births per year translates into a loss of half of a first-grade class size per year. *(See Table II-1-1 and Figure 7).*

The “best fit” projections used the 3-year average, or the 2022-23 “Best Fit” Model for Buxton assumes resident births would average about 73 births annually.

#### D. Net Preschool Migration Trends

In the first five years of the last decade, (2013-14 to 2017-18), Buxton experienced an out-migration of preschool-aged children, with an average migration ratio of 0.986, or first grade experienced an average decline of about 1.4% from the number of births six years prior. In the past five years, (2018-19 to 2022-23), Buxton experienced a higher level of preschool out-migration, with an average migration ratio of 0.885, or an average decline of 11.5%. Additionally, over the last three years, (2020-21 to 2022-23), preschool out-migration continued, it was higher than the five-year period, with an average ratio of 0.840, or an average 16% loss from births. **Overall, when looking at average migration trends the average preschool out-migration placed downward pressure on first grade class sizes. (See Table II-1-1).**

**NOTE:** Taken together, a decline in average resident births combined with an average preschool out-migration resulted in first grade class sizes that, on average, declined over the last five years.

#### E. Projections of Entering First Grade Class Sizes

The 2022-23 “Best Fit” Model is based on 73 average births, and on a continuation of preschool out-migration similar to the level occurring over the last 3 years, except for the 2023-24 first grade which was based on the 2022-23 Kindergarten. *(See Table II-1-1 and Figure 8).*

- Under the 2022-23 “Best Fit” Model, first grade enrollment is projected to experience yearly swings corresponding with swings in resident births. Enrollment is projected to range between 50 and 74 students, and average 63 students annually through 2032-33.

#### F. Resident and Attending Enrollment Trends and Projections for Grades PreK-5

##### Historical Trends:

Since 2012-13, Buxton resident attending enrollment in grades PreK-5 declined from 579 students in 2012-13 to reach 482 students by 2019-20. Following 2019-20 enrollment declined further, but remained stable, ranging between 443 and 453 students through 2022-23.

- Enrollment of Buxton students attending out of district schools ranged between 1 and 8 students through 2022-23.

##### 2022-23 “Best Fit” Model:

Under the 2022-23 “Best Fit” Model, PreK-5 resident attending enrollment will decline from the current enrollment of 453 students to reach 403 students by 2027-28. Following 2027-28, enrollment is projected to decline further, but should level off to range between 386 and 399 students through 2032-33.

- Another 4 Buxton resident students in grades PreK-5 are projected to attend non-district schools each year through 2032-33.

**Table II-1-1 - Relationship of Entering First Grade Class Size to Resident Births**

## VI. ATTENDING FIRST GRADE AND PREK-5 ENROLLMENT FOR HOLLIS

---

### A. Historical First Grade Enrollment

First grade enrollment in Hollis over the last ten years (2013-14 to 2022-23) fluctuated year-to-year while declining, on average. During this ten-year period, first grade enrollment ranged between 39 and 53 students, and averaged 46 students. The average first grade enrollment over the last five years (2018-19 to 2022-23), was 43 students, 5 students less than the average of the previous five-year period (2013-14 to 2017-18), or 48 students. Enrollment over the last three years (2020-21 to 2022-23) remained stable, with first grade enrollment averaging 42 students. *(See Table II-1-2 and Figure 11).*

### B. Resident Births Influencing Historical Enrollment

Resident births in Hollis during the ten-year period (2006-07 to 2015-16) influencing first grade enrollment over the last ten years (2013-14 to 2022-23), fluctuated year-to-year, declining, on average. The average number of births over the last five years of the period, (2011-12 to 2015-16), was 45 births, which was only 7 birth lower than the previous five-year period (2006-07 to 2010-11), which had an average of 52 births per year. In addition, over the last three years of the period (2013-14 to 2015-16) births continued the decline, averaging 43 births annually. *(See Table II-1-2 and Figure 10).*

### C. Resident Births Influencing Future Enrollment

Over the last ten-years, 2012-13 to 2021-22, births to residents of Hollis increased, to average 47 births annually, with births significantly fluctuating year-to-year, ranging between 33 and 53 births. The most recent five-year period (2017-18 to 2021-22) increased to average 49 births, and over the last three years (2019-20 to 2021-22) the average of births to residents averaged 47 births. When looking at the most recent average of births compared to births between 2006-07 and 2010-11 (average of 52 births per year), Hollis experienced an average loss of about 4 or 5 births per year. *(See Table II-1-2 and Figure 10).*

The “best fit” projections used the 5-year average, or the 2022-23 “Best Fit” Model for Hollis assumes resident births would average about 49 births annually.

#### **D. Net Preschool Migration Trends**

In the first five years of the last decade, (2013-14 to 2017-18), Hollis experienced an out-migration of preschool-aged children, with an average migration ratio of 0.936, or first grade experienced an average decline of about 6.4% from the number of births six years prior. In the past five years, (2018-19 to 2022-23), Hollis experienced almost no preschool out-migration, with an average migration ratio of 0.993, or an average decline of 0.7%. Additionally, over the last three years, (2020-21 to 2022-23), a slight preschool in-migration occurred, with an average ratio of 1.007, or an average 0.7% gain from births. However, when looking at the migration trends on the year-to-year basis, preschool migration is not quite so stable, with wide swings from an in-migration of 20.9% to an out-migration of 2.4%, then 16.7% back to an in-migration of 21.2%. The large fluctuations are common when looking at smaller population sizes, and it becomes important to note that projections are more difficult due to the nature of these year-to-year variances. (*See Table II-1-2*).

#### **E. Projections of Entering First Grade Class Sizes**

The 2022-23 “Best Fit” Model is based on 49 average births, and on a continuation of preschool migration similar to the level occurring over the last 3 years. (*See Table II-1-2 and Figure 11*).

- Under the 2022-23 “Best Fit” Model, first grade enrollment is projected to experience yearly swings corresponding with swings in resident births. Enrollment is projected to range between 45 and 53 students, and average 50 students annually through 2032-33.

#### **F. Resident and Attending Enrollment Trends and Projections for Grades PreK-5**

##### **Historical Trends:**

Since 2012-13, Hollis’s resident attending enrollment in grades PreK-5 fluctuated year-to-year, ranging between 308 and 344 students through 2015-16. Following 2015-16 enrollment declined to reach 259 students in 2020-21 before increasing to 278 students by 2022-23.

- *Enrollment of Hollis students attending out of district schools ranged between zero and 5 students through 2022-23.*

##### **2022-23 “Best Fit” Model:**

Under the 2022-23 “Best Fit” Model, PreK-5 resident attending enrollment will increase from the current enrollment of 278 students to reach 300 students by 2026-27. Following 2026-27, enrollment is projected to increase further, but should level off to range between 301 and 308 students through 2032-33.

- *Another 3 Hollis resident students in grades PreK-5 are projected to attend non-district schools each year through 2032-33.*

**Table II-1-2 - Relationship of Entering First Grade Class Size to Resident Births**

## VII. ATTENDING FIRST GRADE AND PREK-5 ENROLLMENT FOR LIMINGTON

---

### A. Historical First Grade Enrollment

First grade enrollment in Limington over the last ten years (2013-14 to 2022-23) fluctuated year-to-year while increasing, on average. During this ten-year period, first grade enrollment ranged between 34 and 52 students, and averaged 42 students. The average first grade enrollment over the last five years (2018-19 to 2022-23), was 44 students, or 4 students more than the average of the previous five-year period (2013-14 to 2017-18), or 40 students. However, enrollment over the last three years (2020-21 to 2022-23) declined, with first grade enrollment averaging 40 students. (*See Table II-1-3 and Figure 14*).

### B. Resident Births Influencing Historical Enrollment

Resident births in Limington during the ten-year period (2006-07 to 2015-16) influencing first grade enrollment over the last ten years (2013-14 to 2022-23), fluctuated year-to-year, declining, on average. The average number of births over the last five years of the period, (2011-12 to 2015-16), was 48 births, which was only 1 birth higher than the previous five-year period (2006-07 to 2010-11), which had an average of 47 births per year. however, over the last three years of the period (2013-14 to 2015-16) births declined slightly, averaging 45 births annually. (*See Table II-1-3 and Figure 13*).

### C. Resident Births Influencing Future Enrollment

Over the last ten-years, 2012-13 to 2021-22, births to residents of Limington increased, to average 43 births annually, with births significantly fluctuating year-to-year, ranging between 29 and 56 births. The most recent five-year period (2017-18 to 2021-22) remained stable to average 42 births, and over the last three years (2019-20 to 2021-22) the average of births to residents declined to 37 births. When looking at the most recent average of births compared to births between 2006-07 and 2010-11 (average of 47 births per year), Limington experienced an average loss of about 10 births per year. (*See Table II-1-3 and Figure 13*).

The “best fit” projections used the 3-year average, or the 2022-23 “Best Fit” Model for Limington assumes resident births would average about 37 births annually.

#### **D. Net Preschool Migration Trends**

In the first five years of the last decade, (2013-14 to 2017-18), Limington experienced an out-migration of preschool-aged children, with an average migration ratio of 0.870, or first grade experienced an average decline of about 13% from the number of births six years prior. In the past five years, (2018-19 to 2022-23), Limington experienced less preschool out-migration, with an average migration ratio of 0.925, or an average decline of 7.5%. However, over the last three years, (2020-21 to 2022-23), preschool out-migration increased again, with an average ratio of 0.885, or an average loss of 11.5% from births. When looking at the migration trends on the year-to-year basis, preschool migration experienced wide swings from an out-migration of 7.1% to no migration, to an out-migration of 20.8%, then 13.6. The large fluctuations are common when looking at smaller population sizes, and it becomes important to note that projections are more difficult due to the nature of these year-to-year variances. (*See Table II-1-3*).

#### **E. Projections of Entering First Grade Class Sizes**

The 2022-23 “Best Fit” Model is based on 37 average births, and on a continuation of preschool out-migration similar to the level occurring over the last 6 years, except for the 2023-24 first grade which was based on the 2022-23 Kindergarten class size. (*See Table II-1-3 and Figure 14*).

- Under the 2022-23 “Best Fit” Model, first grade enrollment is projected to experience yearly swings corresponding with swings in resident births. Enrollment is projected to range between 31 and 46 students, and average 37 students annually through 2032-33.

#### **F. Resident and Attending Enrollment Trends and Projections for Grades PreK-5**

##### **Historical Trends:**

Since 2012-13, Limington resident attending enrollment in grades PreK-5 fluctuated year-to-year, ranging between 244 and 254 students through 2016-17. Following 2016-17 enrollment increased to range between 255 and 276 students through 2022-23.

- *Enrollment of Limington students attending out of district schools ranged between zero and 4 students through 2022-23.*

##### **2022-23 “Best Fit” Model:**

Under the 2022-23 “Best Fit” Model, PreK-5 resident attending enrollment will decline from the current enrollment of 271 students to reach 214 students by 2032-33.

- *Another 1 or 2 Limington resident students in grades PreK-5 are projected to attend non-district schools each year through 2032-33.*

## VIII. ATTENDING FIRST GRADE AND PREK-5 ENROLLMENT FOR STANDISH

---

### A. Historical First Grade Enrollment

First grade enrollment in Standish over the last ten years (2013-14 to 2022-23) fluctuated year-to-year while declining, on average. During this ten-year period, first grade enrollment ranged between 64 and 94 students, and averaged 78 students. The average first grade enrollment over the last five years (2018-19 to 2022-23), was 74 students, 9 students less than the average of the previous five-year period (2013-14 to 2017-18), or 83 students. Enrollment over the last three years (2020-21 to 2022-23) declined a bit more, with first grade enrollment averaging 72 students. (*See Table II-1-4 and Figure 16*).

### B. Resident Births Influencing Historical Enrollment

Resident births in Standish during the ten-year period (2006-07 to 2015-16) influencing first grade enrollment over the last ten years (2013-14 to 2022-23), fluctuated year-to-year, but remained stable, on average. The average number of births over the last five years of the period, (2011-12 to 2015-16), was 84 births, which was only 1 birth lower than the previous five-year period (2006-07 to 2010-11), which had an average of 85 births per year. In addition, over the last three years of the period (2013-14 to 2015-16) births continued to remain stable, averaging 86 births annually. (*See Table II-1-4 and Figure 16*).

### C. Resident Births Influencing Future Enrollment

Over the last ten-years, 2012-13 to 2021-22, births to residents of Standish declined, to average 78 births annually, with births significantly fluctuating year-to-year, ranging between 59 and 90 births. The most recent five-year period (2017-18 to 2021-22) increased to average 76 births, and over the last three years (2019-20 to 2021-22) the average of births to residents averaged 73 births. When looking at the most recent average of births compared to births between 2006-07 and 2010-11 (average of 85 births per year), Standish experienced an average loss of about 11 births per year. (*See Table II-1-4 and Figure 17*).

The “best fit” projections used the 3-year average, or the 2022-23 “Best Fit” Model for Standish assumes resident births would average about 97 births annually.

#### **D. Net Preschool Migration Trends**

In the first five years of the last decade, (2013-14 to 2017-18), Standish experienced an in-migration of preschool-aged children, with an average migration ratio of 1.013, or first grade experienced an average increase of about 1.3% from the number of births six years prior. In the past five years, (2018-19 to 2022-23), Standish experienced a preschool out-migration, with an average migration ratio of 0.970, or an average decline of 3%. Additionally, over the last three years, (2020-21 to 2022-23), a slight preschool out-migration continued, with an average ratio of 0.903, or an average 9.7% loss from births. However, when looking at the migration trends on the year-to-year basis, preschool migration is not quite so stable, with wide swings from an in-migration of 6.5% to an out-migration of 9.2%, then a 5.8% in-migration, back to an out-migration of 25.7%. (*See Table II-1-4*).

#### **E. Projections of Entering First Grade Class Sizes**

The 2022-23 “Best Fit” Model is based on 97 average births, and on a continuation of preschool migration similar to the level occurring over the last 3 years. (*See Table II-1-4 and Figure 17*).

- Under the 2022-23 “Best Fit” Model, first grade enrollment is projected to experience yearly swings corresponding with swings in resident births. Enrollment is projected to range between 84 and 103 students, and average 92 students annually through 2032-33.

#### **F. Resident and Attending Enrollment Trends and Projections for Grades PreK-5**

##### **Historical Trends:**

Since 2012-13, Standish resident attending enrollment in grades PreK-5 fluctuated year-to-year, declining from 596 students to reach 508 students by 2022-23.

- *Enrollment of Standish students attending out of district schools ranged between 3 and 10 students through 2022-23.*

##### **2022-23 “Best Fit” Model:**

Under the 2022-23 “Best Fit” Model, PreK-5 resident attending enrollment will increase from the current enrollment of 508 students to reach 548 students by 2028-29. Following 2028-29, enrollment is projected to increase further, but should level off to range between 556 and 573 students through 2032-33.

- *Another 5 to 6 Standish resident students in grades PreK-5 are projected to attend non-district schools each year through 2032-33.*

## IX. ASSESSMENT OF ECONOMIC CONDITIONS, POPULATION TRENDS, AND RESIDENTIAL DEVELOPMENT AND THEIR RELATIONSHIP TO SCHOOL ENROLLMENT

---

Future school enrollment is impacted by past, current, and future trends in population, housing development, and economic conditions. With the growth of a population and development of new homes comes the potential for new students in the school system. Because school enrollment is impacted by residential development, development trends in the district are analyzed. This information is then used to test whether the “best fit” cohort survival enrollment projections adequately reflect the impact of potential residential development trends.

### A. Economic Conditions

*Table IX-1* presents trends in the Civilian Labor Force in MSAD 6, the **Portland-South Portland Metropolitan Area (Metro)**, and the State of Maine. Between 2018 and 2022, the **Portland-South Portland Metro’s** Civilian Labor Force declined by 2.5% from 209,867 to 204,667, with a loss of 5,200 workers. The number of people unemployed remained stable in the **Portland-South Portland Metro** with the unemployment rate of 2.6% in 2018 and 2.5% in 2022. In the State of Maine, the unemployment rate also remained stable with an unemployment rate of 3.2% in 2018 and 3% in 2022, while the Civilian Labor Force declined by 4% over the period.

MSAD 6’s Civilian Labor Force a decline, with a loss of 402 workers or 2.6% between 2018 and 2022. MSAD 6’s decline in the Civilian Labor Force was similar to the loss experienced in the **Portland-South Portland Metro** (loss of 2.5%), but less than the loss in the State of Maine as a whole (loss of 4%.) MSAD 6 also experienced a stable level of unemployment between 2018 and 2022, with the unemployment rate staying at 2.7% in 2018 and 2022.

Looking at overall trends, while the unemployment rate in MSAD 6 remained stable, there was a loss in the Civilian Labor Force. However, the loss of Civilian Labor Force was not so significant that it likely had an impact on school enrollment. Therefore, no changes to the 2022-23 “Best Fit” Model are necessary to account for changes in employment in MSAD 6. However, if significant change in the Civilian Labor Force occurs in the future, then the potential impact on school enrollment from economic condition changes might need to be reassessed.

## B. Population Trends

*Table IX-2* presents the population trends for MSAD 6 in comparison to Cumberland County, York County, and the State using data from the U.S. Census. In 2000, MSAD 6's total population was 24,254 people, increasing by 1,648 people to 25,902 by the year 2010, a 6.8% gain in total population. Between 2000 and 2010 Cumberland County experienced growth in total population, with an increase 8.3%, and York County increased by 5.6% while the population of the State of Maine increased by 4.2%. By 2020, MSAD 6's total population increased by 1,355 people to reach 27,257 people, for a 5.2% gain in total population, a slightly lower overall increase compared to what happened between 2000 and 2010. MSAD 6's overall population growth (6.8%) fell between Cumberland County (8.3%) and York County (5.6%) and was more than the State of Maine which increased by 4.2%.

The under 18 years of age population of MSAD 6 was 6,252 in 2000, by 2010, the under 18 population declined by 7.1% to 5,807 children, with a loss of 445 children. Between 2000 and 2010 Cumberland County and York County experienced loss in the under 18 population, with a loss of 5% and 8.5% while the under 18 population of the State of Maine declined by 8.9%. By 2020, MSAD 6's the under 18 population continued to decline, reaching 5,125 and losing another 11.7% or 682 children over the period. Over the last ten years between 2010 and 2020, the population of people under 18 years of age declined by 5% in Cumberland County, while York County declined by 8.5% and the State of Maine declined by 8.1%. The declines between 2010 and 2020 were very similar to what occurred between 2000 and 2010.

The school-aged population of MSAD 6 (5 to 17 years of age) was 4,775 in 2000. By 2010, that figure declined by 8.6% to 4,364 students, for a loss of 411 school-aged children. Between 2000 and 2010 Cumberland County experienced loss in school-aged population, with a loss of 21.9%, and York County declined by 9.9% while the population of the State of Maine declined by 11.1%. By 2020, MSAD 6's school-aged population declined by 525 people to reach 3,839 people, for a 12% loss in population, a higher overall decline compared to what happened between 2000 and 2010. MSAD 6 school-aged population loss (12%) was higher than Cumberland County (4.8%) and York County (8.3%) and the State of Maine which declined by 6.9%.

When we look at MSAD 6's population of fertile females (women who are 18 to 44 years of age), in 2000 there were 5,171 fertile females and by 2010 that figure declined by 10.3% or 534 women to reach a population of 4,637. Between 2000 and 2010 Cumberland County experienced loss in the fertile female population, with a loss 7.6%, and York County declined by 10.9% while the under 18 population of the State of Maine declined by 10%. By 2020 the fertile female continued to decline in MSAD 6 but at a much slower rate. By 2020 the fertile female population declined to reach 4,489 or by 3.2%, losing another 148 children over the period. However, between 2010 and 2020, the fertile female population increased by 6.4% in Cumberland County and by 5.1% in York County, while the State of Maine declined slightly by 1.8%.

Looking at the population of women who are generally considered past their fertile age, or women 45 years of age or older, MSAD 6 experienced a significant increase in population. Between 2000 and 2010, the population of women who are 45 years of age or older increased from 4,092 women to reach 5,567 women in 2010, for a gain of 1,475 women, or 36% over the period. Between 2000 and 2010 Cumberland County experienced growth in population of women who are 45 years or older, with an increase 25%, and York County increased by 28.7% while the population of the State of Maine increased by 22.8%. By 2020, MSAD 6's 45+ female population increased by 1,083 people to reach 6,650 women, for

a 19.5% gain in population, a lower overall increase compared to what happened between 2000 and 2010. MSAD 6 growth (19.5%) in population of women who are 45+ was higher than Cumberland County (14.4%) and York County (15.4%) and was more than the State of Maine which increased by 9.4%. However, it is important to note the increase in this 45+ female population seems to have slowed.

The implication is while the fertile female population has declined over the last twenty years, there has been significant growth in the population of women who have matured past the generally accepted age of fertility, or women who are 45 years of age or older. While the rate of growth has slowed, the continued growth in the 45 years of age or older female population and decline in the fertile female population would have had an impact on resident birth trends, which was evident in the decline noted in resident births since 2005-06.

## C. Residential Development Trends

Trends in housing development are influenced by national and regional economic trends and local land-use policies. Two sets of data are used to examine residential development trends, the U.S. decennial Census and the American Community Survey for housing units and annual local new housing unit data.

### 1. U.S. Census Data

In 2010, total housing units in MSAD 6 had increased from 8,888 units in 2000 to reach 10,103 units, for an increase of 13.7% (gain of 1,215 units), or an average of 122 new units were added annually. (*See Table IX-3*). By 2020, total housing units in MSAD 6 had increased to 10,912 units, an increase of 8% (gain of 809 units), or an average of 81 new year-round housing units were added annually. This indicates that while new homes were added, the overall new home development slowed over the last ten years. When looking at Cumberland County and York County, both counties experienced an increase in year-round housing units, but the pattern was the same, with more new home development occurring between 2000 and 2010 than between 2010 and 2022. To account for more recent development, the most recent year-to-year residential development trends will be analyzed next.

<b>Table IX-3 - Housing Trends 2000-2020</b> <b>MSAD 6 vs. Cumberland County, York County, and the State of Maine</b>									
Area	# of Year-Round Housing Units			Change (2000-2010)		Average # Added/Year	Change (2010-2020)		Average # Added/Year
	2000	2010	2020	# of units	% Change		# of units	% Change	
Buxton	2,858	3,225	3,414	367	12.8%	37	189	5.9%	19
Hollis	1,547	1,747	1,921	200	12.9%	20	174	10.0%	17

<b>Note:</b> Year-Round Housing unit data excludes Seasonal and Migrant Housing. <b>Source:</b> 2000, 2010, and 2020 Decennial Census									

## 2. Local Housing Data

*Table IX-4* presents trends in annual new housing units built in MSAD 6 between 2002 and 2022. Local residential housing data is examined to estimate housing units in the future and to determine if residential development in MSAD 6 is impacting school enrollment trends. Data on annual new housing units added since 2002 is used to analyze residential development trends and was obtained from various sources including the State of the Cities Data Systems (SODCS), Office of Policy Development and Research, US Department of Housing and Urban Development, from the US Census Bureau and from each Town in MSAD 6. While these figures have come from various sources, it should be accurate enough to determine the impact housing may have had on school enrollment. *(See Table IX-4 and Figure 19.)*

Since 2002, permits for new housing units fluctuated year-to-year, ranging between 34 and 221 units annually through 2022. When looking at new housing units added over the last 10-years, on average, 107 new housing units have been added annually since 2013. Over the last five years (2018 to 2022), 121 new housing units were added annually while the previous five-year period (2013 to 2017) experienced average growth of 93 new housing units per year. Looking at the last three years of data, (2020 to 2022), on average, 130 new housing units were added annually.

Future new housing development is often difficult to predict and depends on demand, developer interest, availability of buildable lots and the economy. Future development is unlikely to continue to increase above and beyond the most recent levels and is more likely future development will remain at average levels seen over the last three to five-year periods. Therefore, future new housing development will likely continue to fluctuate year-to-year based on demand and will likely continue somewhere around 100 to 155 new housing units added annually at least for the near future.

To determine what the potential impact is on enrollment from future new housing unit development we first need to look at historical impacts of housing unit development on preschool and elementary migration in MSAD 6 to determine what impact, if any, historical new housing unit development has had on historical enrollment.

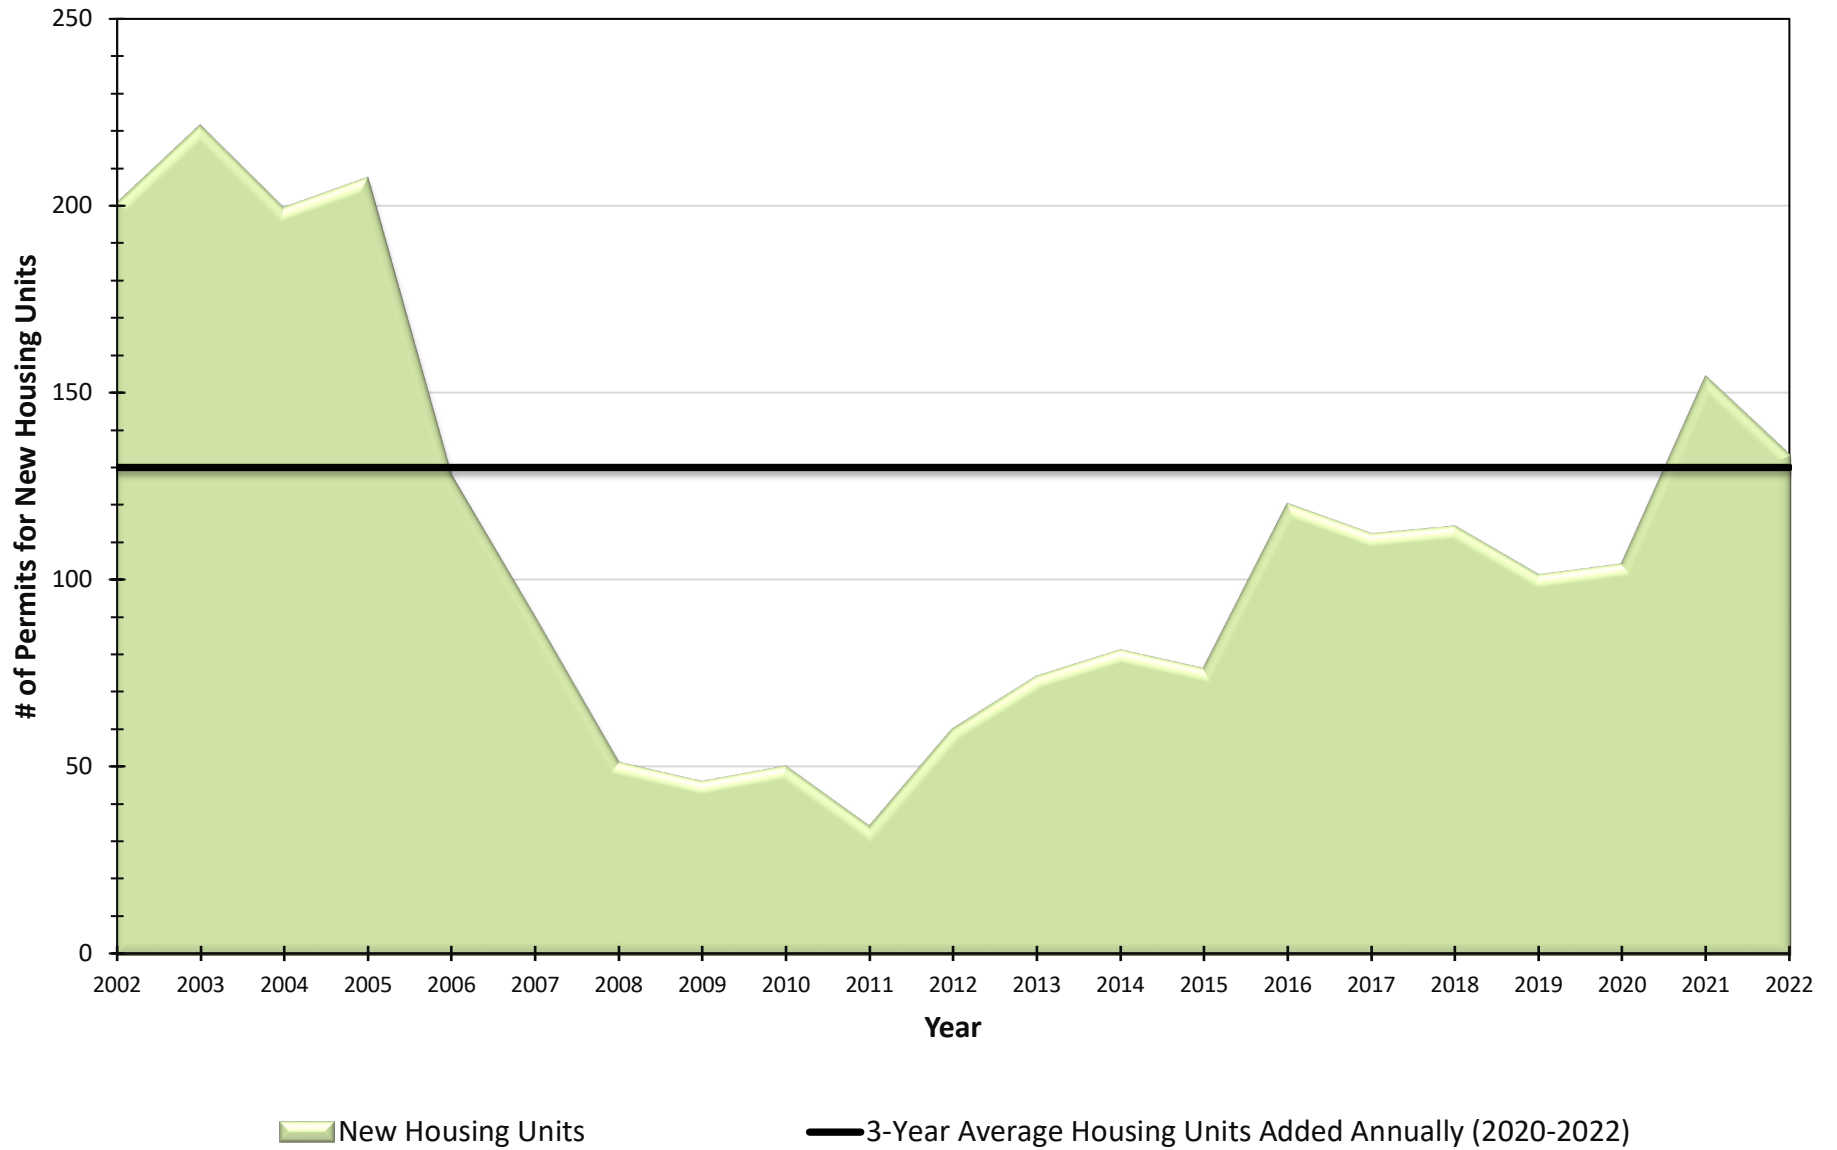

**Table IX-4**  
**Trends in New Housing Units - 2002-2022 - MSAD 6**

Calendar Year	Buxton	Hollis	Limington	Standish	New Housing Units

Figure 19

### New Housing Units MSAD 6 (2002 - 2022)

## D. Relationship of Residential Development to School Enrollment

The “best fit” cohort survival does not directly incorporate the level of residential development and turnover in the existing housing stock when projecting school enrollment. Instead, the survival ratios used within cohort models reflect the historical impact of net migration (which is influenced by residential development and turnover) on school enrollment. What this means is, if future residential development levels, turnover levels, or their relationship to net migration is **significantly** different from levels experienced in the past ten years, then the “best fit” cohort survival model may overstate or understate future enrollment depends on the strongest statistical correlation of trends. For school planning purposes, understanding the degree to which residential development activity will impact school enrollment is important.

### 1. Net Preschool Migration

To show the relationship between residential development and preschool net migration, the ratios between net preschool migration reflected in the first-grade enrollment and the number of new housing units built in MSAD 6 between the year of the first-grade enrollment year and the six years prior was examined. (*See Table IX-5*).

On average, for each of the six-year periods examined, 506 new homes were built in MSAD 6. There was a net out-migration of preschool-aged children for each of the first-grade enrollment years with an out-migration of 15 children, for a ratio of -0.029 children per unit, or a loss of about 3 children for every 100 units built.

When looking at the trends over the last five years between 2013-17 and 2017-21, on average, 525 new housing units were built in MSAD 6, a slightly higher level compared with what occurred over the six-year period. The average out-migration of preschool-aged children for each of the first-grade enrollment years was higher than the 6-year average, or an average out-migration of 20 children occurred, for a ratio of 0.037 children per unit, or a loss around 4 children for every 100 units built.

In addition, when looking at the trends over the last three-year period between 2015-19 and 2017-22, on average, 553 new housing units were built in MSAD 6, an even higher level compared with what occurred over the five-year period. However, over this three-year period, an average out-migration of 30 children occurred, for a ratio of 0.055 children per unit, or a loss of about 6 children for every 100 units built.

When looking at the migration year-to-year, despite the number of new housing units built, preschool migration fluctuated between and in-migration and an out-migration. What this means is preschool migration appears to be working independently of new housing unit development, indicating there is no direct statistical relationship between new residential development and preschool migration trends in MSAD 6. **Without a statistical relationship between historical new housing development and historical preschool migration trends, no adjustment to the 2022-23 “Best Fit” Model will be necessary to account for the impact of new housing unit development on first grade enrollment. Since preschool migration trends can change over time, it will be important for the district to keep an eye on new housing unit development and migration to see if changes occur in the future.**

## 2. Net Elementary (Grades 1-6) Migration

To assess the relationship between residential development levels and migration of students at the elementary grades (first to sixth), the ratio of annual net migration of students at each of the grade levels and annual new housing units built in MSAD 6 during the year was analyzed using the permit data for the preceding year. (See *Table IX-6*).

In the ten years between 2012 and 2021, (the permit year before the enrollment year is used here), MSAD 6 experienced an average net out-migration of 14 elementary students while migration significantly fluctuated year-to-year between an out-migration of 67 students and an in-migration of 14 students. The average ratio of out-migration of elementary students (1-6) to new housing units was -0.141, or, on average, over the last ten years for every 100 housing units built in MSAD 6 an out-migration of almost 14 students occurred in grades 1-6, on average.

MSAD 6 experienced an out-migration of 21 elementary students over the last five years (2017 to 2021), for an average migration ratio of 0.178. Or, on average, over the last five years for every 100 housing units built in MSAD 6 an out-migration of about 18 elementary-aged students occurred.

Looking at development over the last three years (2019 to 2021) an average of 120 new housing units were added and MSAD 6 experienced an average out-migration of 25 elementary students, with an out-migration ratio of 0.209. Or, on average, over the last three years for every 100 housing units built in MSAD 6 an out-migration of about 210 elementary-aged students occurred.

Elementary migration fluctuated between and in-migration and an out-migration of students despite the number of new housing units built, and migration was an average out-migration overall. What this means is elementary migration appears to be working independently of new housing unit development, and no direct statistical relationship between residential development and elementary migration trends in MSAD 6 are seen. **Without a statistical relationship between historical new housing development and historical elementary migration trends, no adjustment to the 2022-23 “Best Fit” Model will be necessary to account for the impact of new housing unit development on elementary migration.**

**Table IX-6**  
**Net Elementary (1-6) Migration and New Housing Unit Development**  
**MSAD 6**

Enrollment Years	Net Migration	Permit Year	# of New Housing Units	Ratio Migr/Perm
2012-13 to 2013-14	-29	2012	60	-0.483
2013-14 to 2014-15	-13	2013	74	-0.176

**Sources:** Net Migration - Calculated based on October 1st Resident Enrollment data from MDOE. **Residential New Housing Units:** 2012-2022 from State of the Cities Data Systems (SOCDS), Office of Policy Development and Research, US Department of Housing and Urban Development

## **E. Summary and Recommendations Regarding Economic Conditions, Population Trends, and Residential Development**

Based on recent trends, MSAD 6 most likely will continue to experience a level of growth similar to what has occurred over the last three to five-years with 100 to 150 new housing units added per year. When looking at historical residential development compared with historical preschool and elementary migration, the migration of students fluctuated significantly despite the number of new housing units added. Therefore, no direct statistical relationship between the addition of new housing units and preschool and elementary migration was found.

The 2022-23 “Best Fit” Model is a standard statistical model which projects enrollment based on historical trends and is the most likely scenario to occur in MSAD 6 if future enrollment follows the historical pattern of enrollment. At this time, there is no statistical support for an additional model based on the impact of housing development, economic conditions, or population trends. However, it is important to note that if future recessions or economic booms occur, if another Pandemic occurs, or if significant residential development and/or population changes occur, the enrollment projections would need to be reassessed.

---

## X. SUMMARY OF ENROLLMENT PROJECTIONS FOR SCHOOL PLANNING PURPOSES

---

To provide reasonable cushions for use in planning school facilities, the enrollment projections by grade group and presented the projections within ranges of plus and minus 10% for the PreK-8 grade groups, and plus and minus 5% for grades 9-12. In addition, more conservative ranges of 3% across all grade levels are supplied. These ranges should provide the school district with some idea of what future enrollment would look like under different scenarios. The report **Appendix** contains grade by grade historical and projected enrollment.

**Notes:** Based on October 1st Enrollment. Enrollment data contains all resident students attending district schools, excludes 100% homeschooled students. Enrollment data supplied by MDOE. Future births between 2022-23 and 2025-26 were based on the sum of average of births used to make each communities projections. \*2022 birth data is preliminary and provisional from the Maine Department of Health and Human Services, Office of Data, Research, and Vital Statistics. The first grade from 2024-25 to 2032-33 was projected using the 10-year ratio of first grade to births, the 2023-24 first grade class sizes were based on the 2022-23 Kindergarten enrollment and the 3-year weighted ratio of first grade to Kindergarten.

**Births:** Maine Center for Disease Control and Prevention, Data, Research and Vital Statistics. 2022 births are preliminary and provisional; \*Future births between 2022-23 and 2025-26 were based on the sum of the births used for each town's first grade enrollment projections. **Note:** Enrollment includes all resident students attending district schools. First to birth ratios shown here are based on the rounded first grade projection from the Entering Class to Births Ratio Worksheet. **Historical Enrollment Source:** 2012-2017 from MDOE, 2018-2022 from the district. All else calculated by Wandell Consulting.

**Notes:** Based on October 1st Enrollment. Enrollment data contains all resident students attending district schools, excludes 100% homeschooled students. Enrollment data supplied by MDOE and MSAD 6. Future births between 2022-23 and 2025-26 were based on the 3-year average of births (2019-20 to 2021-22). \*2022 birth data is preliminary and provisional from the Maine Department of Health and Human Services, Office of Data, Research, and Vital Statistics. The first grade from 2024-25 to 2032-33 was projected using the 3-year ratio of first grade to births, the 2023-24 first grade class size was based on the 2022-23 Kindergarten enrollment.

**Notes:** Based on October 1st Enrollment. Enrollment data contains all resident students attending district schools, excludes 100% homeschooled students. Enrollment data supplied by MDOE and MSAD 6. Future births between 2022-23 and 2025-26 were based on the 5-year average of births (2017-18 to 2021-22). \*2022 birth data is preliminary and provisional from the Maine Department of Health and Human Services, Office of Data, Research, and Vital Statistics. The first grade from 2023-24 to 2032-33 was projected using the 3-year ratio of first grade to births.

**Notes:** Based on October 1st Enrollment. Enrollment data contains all resident students attending district schools, excludes 100% homeschooled students. Enrollment data supplied by MDOE and MSAD 6. Future births between 2022-23 and 2025-26 were based on the 3-year average of births (2019-20 to 2021-22). \*2022 birth data is preliminary and provisional from the Maine Department of Health and Human Services, Office of Data, Research, and Vital Statistics. The first grade from 2024-25 to 2032-33 was projected using the 6-year ratio of first grade to births, and the 2023-24 first grade class size was based on the 2022-23 Kindergarten enrollment.

**Notes:** Based on October 1st Enrollment. Enrollment data contains all resident students attending district schools, excludes 100% homeschooled students. Enrollment data supplied by MDOE and MSAD 6. Future births between 2022-23 and 2025-26 were based on the 3-year average of births (2019-20 to 2021-22). \*2022 birth data is preliminary and provisional from the Maine Department of Health and Human Services, Office of Data, Research, and Vital Statistics. The first grade from 2024-25 to 2032-33 was projected using the 10-year weighted ratio of first grade to births, the 2023-24 first grade class size was based on the 2022-23 Kindergarten enrollment.

## **APPENDIX B**

# **INFORMATION ON ENROLLMENT DATA & METHODOLOGIES USED FOR PROJECTION STUDIES**

## Enrollment Data and Methodologies Used for Projection Studies

---

### Enrollment Data Used for the Projection Study:

- The enrollment data used for these projections is based on the October 1<sup>st</sup> resident enrollment count by school year. Historical enrollment data is obtained directly from the Maine Department of Education. If a study is completed in October to December of a school year the data may need to be obtained directly from the school district. Sometimes data supplied by the school district is different from what MDOE will show because of reporting differences, inconsistencies or errors adjusted over time. Although it does not happen often, it is important to understand it can happen and is often the source of differences in enrollment count between studies.
- It is also important to understand the resident enrollment and attending enrollment figures will not necessarily correlate with EPS funding counts of students. Specifics on what is included in the different types of enrollment counts, please visit the MDOE data center: <https://www.maine.gov/doe/data-reporting/reporting/warehouse>

### Types of Enrollment Data:

1. **Total Resident Enrollment:** the count of all students living in the district's town(s) regardless of where they attend school.
2. **Attending Resident Enrollment:** the count of resident students attending a district's school(s).
3. **Enrollment of Resident Students Attending Out of District Schools:** the count of resident students attending other district schools either as tuition students, choice tuition students, superintendent agreements, or other such similar situations.
4. **Non-Resident Attending Enrollment:** is the count of students from other districts attending the resident district's schools.
5. **Private School Enrollment:** is the count of students attending private schools. Enrollment of students attending private schools is often excluded from the study because private schools do not always submit their enrollment counts, or MDOE did not always include the data in the resident enrollment count. For example, the enrollment for one year will show 10 students attending private school X, the following year

there are zero students attending private school X, then in the next school year private school X suddenly has an enrollment of 15 students. These variations in enrollment count only serve to distort the migration trends used to make the projections.

However, private school student enrollment will remain if the district in question pays for students to attend the private school. An example of this is Saco students attending Thornton Academy. In these cases, the private school enrollment count is consistently reported and there are no issues with consistency of historical data.

6. **Home Schooled Students:** is the count of students educated at home. Historical enrollment data of home-schooled students is inconsistent. Some districts do a good job of tracking home schooled students by grade, others only have grade group data, some have the information for several school years while others may only have information readily available on the most recent couple of school years. MDOE also has historical home-schooled enrollment, but the counts are not as readily available. Therefore, home schooled enrollment is generally not projected unless a district can provide consistent data.

**PAST Projections verse CURRENT Projections:** When comparing past enrollment studies to future studies, it is important to understand the differences in enrollment data. With the older enrollment studies a detailed breakdown of enrollment was often not readily available. In other cases, the data supplied by a district for the past study was adjusted by the district and/or MDOE following the completion of the projections. When comparing past studies to current studies, be sure to compare data that shows the same type of enrollment count. In some districts there is very little difference between resident attending enrollment and total resident enrollment, while in other districts there is a significant difference in the enrollment count. **Methodology Notes:**

- **Resident Births:**

When making projections, the calendar year birth figures are not used to determine the number of resident births in a year. To project future entering first grade class sizes the "birth year" is based on when a student is eligible to enroll, or from October 15th of one year to October 14th of the next. Because the data supplied by the office of Data, Research, and Vital Statistics, Division of Public Health Systems, Maine Centers for Disease Control and Prevention at the Maine Department of Health and Human Services for October is based on October 1st to the 31st, the October births are split in half so that one half is put into one year and the other half is put into the following year's birth figures. This allows the cohort survival model to more accurately project entering first grade class sizes.

Birth data from calendar year 2022 is preliminary and provisional, however, historically this data has been very accurate.

- **First Grade Class Sizes:**

The size of the first grade class is influenced by two factors: the number of births to residents of a community during the year that is six years prior to the enrollment year; and, net migration of preschool aged children (number of preschool aged children moving into the community minus the number of preschool aged children moving out of the community) during the first grade enrollment year and the year that was six years prior. The level of preschool migration can be measured by the ratio of enrollment for the entering first grade class to the number of births to residents in the year that was six years prior.

- **Net Migration Ratios:**

In making grade-to-grade projections, the historical average grade-to-grade survival ratios over the last three to ten years are analyzed. The average that displays the “strongest” statistical relationship to existing class sizes are used to project future enrollment.

When net migration ratios are discussed throughout the study, a ratio higher than 1.000 indicates a net in-migration of children occurred, and a ratio less than 1.000 indicates a net out-migration of children occurred.
